AutoCAD Crack With Key

Essentially, AutoCAD is a building or drafting program where you can design and layout buildings, objects, spaces, etc. The most common uses of AutoCAD are for architectural, engineering, landscaping, or engineering drafting. You can also use it to map out city streets. The AutoCAD feature list is extensive, but here is a short list of some of the features you'll want to make the most of. Projecting Using the MIRROR command in the SELECT/INSPECT selection or on the drawing canvas, you can mirror the active selection, selection or object. You can also mirror a selected area, or the entire drawing or drawing area. You can mirror a straight edge, arc, curve or line. You can quickly switch the orientation of a line or polyline, but not of individual faces. You can also mirror a multiple selection, which is an automated process of mirroring the active selection. The intent of the multiple selection is to toggle the mirroring of the selected objects on and off. Using the command LINEARIZE, you can turn a line segment, arc, or spline into a regular line segment. The process takes a few seconds to complete, but the result is much more crisp and accurate. There are no real-time lines you can mirror that are off-axis. You can only mirror a line with respect to a single point. When you are creating a mirror with the MIRROR command, the new mirrored object follows the regular rules for object placement. So you can place the mirrored object outside the mirror range, but when you start to place the mirrored object, it is replaced with the original selection, which then appears inside the mirror range. You can create and edit mirrored lines in the same way you create and edit regular lines. For example, if you are creating a horizontal line, click to place a line, then click to place a mirrored line, then you can edit both lines at the same time. If you try to edit an object outside the mirror range, the command will abort with an error. The same is true for trying to place an object outside the mirror range. Mirrored items follow the rules for selection. So, you can have mirrored lines and arcs. If you have mirrored lines and arcs, you can edit both at the same time, and you can select both at the same time. To switch the mirrored
