DeskTime (2022)

The wait is over, Windows 10 is here! The Anniversary Update has arrived and brings Windows 10 some awesome new features, which we take a look at today. The Anniversary Update is very much a work in progress, with work still ongoing to refine the UI. While the basic architecture of the OS has been sorted, there's still some bloatware we'd like to get rid of before Windows 10 has been truly refined. We also take a look at some of the new features that have been added, in the vein of the Windows 10 Anniversary Update. The Anniversary Update is available to download now, so you can try it out for yourself right now! Microsoft's Surface Go packs quite a lot of power in a surprisingly small package. The Surface Go is by no means a cheaper alternative to the Surface Pro X, but it is still an extremely competent tablet. Surface Go: Design and performance The Go is designed for two major use-cases: Surf the web and watch movies Its 10.6-inch display is perfect for browsing the web, watching movies on Netflix, and running light office programs. Before buying the Surface Go, consumers are likely to ask themselves the same questions we did when we first got our hands on the device. What's the screen resolution? How long will it last? Can it be customized? We'll cover every last detail in this video. If you want to know how the Surface Go performs in real-life, keep on watching. You can now download the full version of the Windows 10 image for your Surface Go devices from Microsoft's servers directly in Windows Update. This download also includes the new Free Fall 1.1 release. Firmware issues If you also upgraded to the Windows 10 Anniversary Update, you may find that your Surface Go has some very interesting issues. This can be resolved by booting to the Windows 10 Windows Recovery Environment that is now present on the Surface Go device, then running the Windows Updates Troubleshooter tool. Once you have successfully rebooted, go to the Windows Update settings page, then under Current Windows Update status, simply check for Windows 10 updates and hit the Install/Reboot button. After rebooting, you'll be greeted by a new Release Candidate version of the OS which includes a couple of bug fixes, but no other notable changes. Download the firmware from the below
